Hi,

I was systematically using the "GetLastError" function to catch error but I realized these days that I was displaying incomplete content. However I did a test with the "GetErrorStatement" function and it returned the expected content. I have to use the 2 (conditioning if there is content for "GetErrorStatement" then it will be displayed, otherwise use "GetLastError").

I'm confused now!

What do you consider?

```
try
{
    emTransacao = true;
    ret = ( this->*func ) ( vini );
}
catch ( SqlExc )
{
    msg << db.session.GetLastError();
}
```

```
// msg show: Unknown column 'Obsxxx' in 'field list'
```

```
catch ( SqlExc )
{
    msg << db.session.GetErrorStatement()

}
```

```
// msg show: Unknown column 'Obsxxx' in 'field list'(1054): UPDATE SPFOBAASS Set Obsxxx
= '123XXXccc',DataSistema = '2022-
05-06 1 4:01:58', HoraSistema = '2022-05-06 14:01:58', Usuario = 'eu' Where
Codigo='GGG' and DataInicial="2022-02-01"
```

Thanks!
