Hi everyone.
I am currently using upp15620, and I am developing an GUI MT application.
It works fine, but when I close it, I get a segmentation fault origins from a call to the function
MemoryDumpLeaks.
I attach two pictures that show the call stack.
The line where the crash happens is in function MemoryDumpLeaks, where it tries to log a simple
message:
VppLog() << "\n\nHeap leaks detected:\n";

Should I do something to configure a leak detection system? Should I specify a log file for this
message?
Many thanks.
