The IDE only allows me to add one single file or import a whole directory. That is not very convenient most of the time in that I mostly want to add a few files from another directory.

I tried dragging & dropping some files into current package, but the files are added under <temp-aux> node. It's very confusing. Should I create a feature request?

You can also open the .upp file of the project and edit it directly, it's simple text file (I sometimes used that to reorganise the project).

But the drag'n'drop thing sounds like something people may try to do and would be nice if it would work? Can't think of any downside right now.

Manual editing is not what I want because I have to manually collect filenames (how?) and paste them into text editor. Drag & drop is the common easiest way on Windows platform.

I see that U++ team is focused on the framework itself (which is excellent), but they do not quite focus on tiny user-friendly IDE features.

The U++ team is mostly Mirek in recent years, so you have to scale expectations appropriately.

The feedback of fresh eyes is IMHO always very valuable, so keep on going, but if you ever feel also like digging into U++/ide source and try to patch something yourself, it often accelerates

results.

But even just mentioning issues and suggestions may eventually lead to change, Mirek is often on fire...

Hello,

The true thing is that it is already implemented. You can do it via "Insert package directory files(s)..". This option is below "Insert package file.." in package menu. In the past we used this option to add new file, but you could create several files on your disk and then add them manually.

Any contribution are welcome, however it must be thought out. So, if you plan to do bigger contribution, let's discuss it firstly and of course Mirek must like it Today, we have PR mechanism, so the code can be easily reviewed and aligned.

Klugier
