Subject: c++ library version update

At the very last part of the "Development Cycle Guide" it says:

For now, U++ library code should be C++11 compatible, but C++11 should not be required. Parts intended to support C++11 features should be conditionally included using #ifdef CPP_11

U++ now is compatible with c++17. So the library should also compatible with version over c++11.

Needs to be change?

Hello Sayem,

Thanks for reporting. It should be fixed tomorrow. The website is build once per day, so the changes in the source code doesn't reflect immediately.

U++ is compatible with C++20 not c++17. We done it in the latest release.
