Hi,

is there a global/constant variable that tells me whether the desktop program or a skylark server has been loaded by theide or not (in this case it is already in production)?

thanks!

HI,
solution to my problem! (in good IDE this option is traditional!)
In theide, in the main menu, in the option
Debug, run Options and in the Program arguments field, enter a content (as an example: load_by_ide) that will start the control I need. So if you run that program, outside theide, this argument will not be displayed!

```
String s;
const Vector<String>& arguments = CommandLine();
for (int i = 0; i < arguments.GetCount(); i++)
{
   s << arguments[i];
}
//.....................................
Cout() << "argumentos: " << s << EOL;
//.....................................
```

Thanks TheIDE!
