
Subject: StrToInt returning value

Hello,

it seems that StrToInt() return an integer but it can return even a Null in case the conversion cannot be done.

I would like that StrToInt() can return 0 as default instead of Null.

Do we have an alternative version of StrToInt() that return 0 as default?

StrToInt is based on ScanInt

```
int ScanInt(const char *ptr)
{
    int x;
    bool overflow = false;
    return ScanInt<char, byte, uint32, int, 10>(x, ptr, overflow) && !overflow ? x : Null;
}
```

The syntax is too complicated for me. I wonder if the following version can return 0 as wanted

```
int ScanInt0(const char *ptr)
{
    int x;
    bool overflow = false;
    return ScanInt<char, byte, uint32, int, 10>(x, ptr, overflow) && !overflow ? x : 0; //<----
}
```

Thanks,
Luigi

Hello Lugi,

Changes like you proposed all out of scope. The current behavior is with us for a very long period of time and users are used to it. The function behaves in accordance to our documentation. Also changing this behavior to what you have proposed means breaking API change, which should be avoided at all cost. You will literally break dozens of application that relays on this function.

The alternative version doesn't exist, because c++ doesn't allow to have the same functions but with different return type. Anyway, introducing new function we will pollute our API. Keep it simple stupid with one implementation is reasonable in this case.

So, at the moment you just need to align to the current behavior and handle Null as error case.

Well, we already had Atof, so I guess it is logical to have Atoi and Atoi64.
