I have drawn into a report an windows metafile "*.emf" type. I can prewiew and print the report but PDF export doesn't work.PDF report is generated but PDF Reader isn't able to open it.The message is:"There was an error procesing a page. Wrong operand type." WinMetafile is supported by PdfDraw? (Without metafile the export is OK.)

Andrei

No, WinMetaFile is not supported. In fact, it is more or less Win32 hack to get metafiles displayed using the Draw. It is not supported in Linux too.

Perhaps we could consider support in Win32 via rasters...
