Subject: ArrayCtrl get the displayed rows
Posted by forlano on Fri, 30 Jun 2023 06:16:55 GMT

Hello,

I have an ArrayCtrl that is populated by many rows. Its content is displayed automatically scrolling a page at once using arr.ScrollPageDown() and SetTimeCallback().

I need to know when it is displayed the last page/row to restart the procedure from row 1. I cannot find a method to know it or the number of rows per page. In fact it depends by the screen resolution.

Any suggestion to know at least one among number of page, or rows per page, or if it is displayed the last page?
Thanks,
Luigi
