Hi to all

Here are some comments about installing U++ and TheIDE on WSL (Windows Subsystem for Linux).

About WSL install

- The install have been the default one, in powershell, that install Ubuntu (yes, Microsoft install Ubuntu by default) `wsl --install`
- After this, due to GDB problems with OpenGL, the wsl has been updated with `wsl --update --pre-release`

About U++ install

- It has been done following the instructions
- After downloading and copying the files, and before running `./install`, it is necessary to give execute permission `chmod +x ./install`
`chmod +x ./umks32`
- Everything compiles well, but when running TheIDE, it is seen that it is necessary to install `xterm` `gdb`
- To run the OpenGL demo, I have installed this `libglfw3-dev libgl1-mesa-dev libglu1-mesa-dev`

That's it, it works very well!

If you agree, I add in the U++ installation instructions that to install it in WSL, it is necessary to give execution permissions and to include the rest of the dependencies.
