```
SqlCtrls:  
bool Load(Sql& sql, SqlSet set)          { sql * set; return Fetch(sql); }  
#ifndef NOAPPSQL  
bool Load(SqlSet set)                    { return Load(SQL, set); }  
#endif  
bool Load(Sql& sql, SqlId table, SqlBool set);  
#ifndef NOAPPSQL  
bool Load(SqlId table, SqlBool set);  
#endif
```

Instead of

```
SQL * Select(ctrls).From(TABLE).Where(when);  
ctrls.Fetch();
```

which is very common in my code, you can now write

```
ctrls.Load(TABLE, when);
```
