Hello,

I have seen many methods like `IsEncrypted()`, `ChangePassword()`, `Open(..., cypher)`... so it seems that the db can be encrypted. I need not to let the user to open the db with some external tool like DB for Sqlite Browser and performs unwanted operations.

I would like to have a very short example of:

1. how to create a db in some encrypted way;
2. how to read/write data while it is being used by my U++ client (if the queries need some special flag).

From what I read so far it seems that should be enough to open the database in this way:

```
if(!sqliteVT.Open( dbname, some_password,
Upp::Sqlite3Session::CIPHER_CHAHA2020_DEFAULT )) {
...
}
```

all the rest remain the same. Can you confirm?

Many thanks in advance.

Luigi

Hi Luigi,

Yes, it is enough to open database with password and selected cipher. If you need to change password use this function:

```
sqlite3db.ChangePassword(password, Upp::Sqlite3Session::CIPHER_CHAHA2020_DEFAULT)
```

(changing from encrypted to unencrypted is done by entering an empty password)

BR, Radek

Hi Radek,

thanks a lot for both answers!

Changing password with a void one did the trick! Very easy... knowing what to do :d

Best regards,
Luigi
