Hello,

today I moved from Catalina to Monterey and installed latest U++.

I have built theide without problems and compile my program... with only one issue.

How to set /include /lib path to statically link mysqlclient library? (the dynamic link works)

My users does not have such library and even if installed the program is not able to locate it.

With Mojave and an old U++ 2022 edition I was able to do it. Since then with the same setting I had no longer such possibility.

Thanks,

Luigi

After two years I solved the issue.

The problem was the missing ZSTD package under MacOS. Instead under Windows and Linux it seems not required.

Instead I believed the error message was from mysqlclient.

Thanks,

Luigi
