

Hi,

I added a YAML plugin to UppHub.
It is a single Function that returns a Upp::Value.

From the README:

Yaml

A YAML 1.2 parser for the U++, based on libyaml.

Features

- * **Static linking:** The libyaml source is embedded in the package, no external libraries are required.
- * **YAML 1.2 support:** Resolves anchors and aliases at the graph level, expanding them into the resulting Value tree.
- * **Type deduction:** Converts scalars into native U++ types (int, double, bool, String, and Null).
- * **Error handling:** Returns U++ ErrorValue on syntax or structural errors.

Examples

Name	**Description**
