How phrase "U++ leads to code reduction" could be proved or based or supported or... from some "scientific" point of view"?

By code reduction, do you mean code that the programmer writes, or actual code that is compiled?
It seems like U++ adds a lot of code to compile, but it's already written for you.
I think the best way to "prove" that U++ reduces the amount of code that the programmer writes is by hard comparisons.
Take a very simple hello world example and show what its like in U++ and MFC, for example:
http://www.roesler-ac.de/wolfram/hello.htm#C++-MFC
I think a "plain english" way to say it is "U++ takes care of the mundane tasks so you can focus on features"

"very simple" is a bad idea. Just google for "Ultimate++ wxwidgets"..

Sorry, I have expressed myself not clear.
1. I meant "programmer writes"
2. I meant purely among C++ competitors "without comparisons".

Somehow I feel, that sentence with "leads to code reduction" is not very good for wikipedia....
