I would like to use umk on linux, to be able to compile from a text terminal. The installation package does not contain umk binary and I can't find the sources for it. How do I compile umk on linux?

umk for linux is theide. In win32, umk.exe just provides command-line interface (there is trouble with console/GUI app).

I am sorry that this likely will not solve your trouble...

Do you mean that on linux I can invoke theide with the command line params documented for umk, and it will compile a project without bringing up a GUI?

I guess not, because that WOULD solve my trouble. But then why can't I just compile umk from sources on linux? Is it not portable?

Yes, invoking theide with those params will compile without bringing up a GUI.

However if I remember well, the original problem was outdated libraries on target system (maybe that changed thing and I am wrong). And theide still requires GUI libraries to compile & run.

As to other question - umk IS theide. See umk.exe sources - it is just simple wrapper to get GUI theide.exe running in console mode. Known Win32 trouble..

Fine!

WOW you still remember that old problem with outdated GUI libs. But this is not that situation: I am compiling a Core console application on a host with up to date GUI libs. Theide can start on the host, but I would like to use it through text terminal from a remote machine. The console app is statically linked, and later moved to a host where the GUI libs are outdated. The console app BTW parses C++ source files and outputs code metrics in XML report, which is hoped to be automatically post-processed to diagrams showing changes in the code metrics.
