What would be the easiest way to implement multi-line entries to an ArrayCtrl? By that, I mean if the text being entered is longer than the width of the column, LineCy is increased and the text wraps to a new line. I know I can set a control to use for display and edit, but I don't see how to access the parent to SetLineCy()
Ideas?

The only reasonable way (now) is to measure height before setting the data, then use it for SetLineCy.
