This is great - I've been waiting for additions to the tutorial for a while, since I'm a total newbie.

However I noticed that the EditDate widget only seems to accept American (ie: annoying half-backwards, half-forwards) mm-dd-yyyy date formats, and it doesn't seem to have any methods to configure this behaviour (nor the fact that it seems to prompt on "invalid" dates such as 30/6/2006 which is the correct format here, when I try to close the app).
So.. I guess that's a bit strange and I can't see myself using such a widget, but it's great to see the tutorial being updated anyway with useful basic techniques.

EditDate is dependant on language. For example if you set your app to russian:
SetLanguage(LNGC_('R', 'U', 'R', 'U', CHARSET_WIN1251));
then 30.1.2005 is a correct format.
--My guess is you want LNGC_('E','N','I','E', CHARSET_UTF8) but it doesnt look like that works as expected

So, don't spend time guessing imaginable problems... See a problem - ask questions. Don't be shy!

Ah, that makes sense, thanks rbmatt. I'll experiment with locale language settings then.

About the control calling PromptOK when you try to close its parent window if the date entered doesn't validate, is this a setting you can disable, or am I just using it wrong?

I just added it to an existing layout with the (very nice) visual editor.

p.s. Fudadmin: don't worry, I'm not shy at all - I'm always happy to open my big mouth, even if I look like a fool afterwards

Actually, it looks like those settings are only there for like 6 "major" languages.
An easier way:
SetDateScan("dmy");

---

But...please, "open your mouth" in the appropriate sections (for the sake of others)...(This is a releases log...) Happy openings!...

rbmatt wrote on Fri, 11 August 2006 15:43Actually, it looks like those settings are only there for like 6 "major" languages.
An easier way:
SetDateScan("dmy");

Actually, there are two.

SetDateScan makes for ordering of "day" "month" "year" while parsing text to date (note that parsing is quite benevolent - even month names are tested, year can be YY or YYYY, separators

is anything non al-num). There is also SetDateFilter that setups a filter function of date characters.

Opposite conversion is expressed by SetDateFormat - takes a Date, results text. It simply calls Format on the formatting string and date.year, date.month, date.day, DayOfWeek(date) as parameters. Formatting is flexible enough to convert these to any date needed.

When you do SetLanguage, all that really happens is this:

```
 SetDateFormat(t_("date-format\a%2:02d/%3:02d/%1:4d"));
 SetDateScan(t_("date-scan\amdy"));
 SetDateFilter(t_("date-filter\aA/\a .-"));
```

Means those date formatting settings are assigned a "translation" of en-us formatting settings...
(the moral of story is that if you want different settings, setup them after calling the SetLanguage).

SetDateScan("dmy");

Actually, there are two.

SetDateScan makes for ordering of "day" "month" "year" while parsing text to date (note that parsing is quite benevolent - even month names are tested, year can be YY or YYYY, separators is anything non al-num). There is also SetDateFilter that setups a filter function of date characters.

That seems great... but I still can't make it work.

```
GUI_APP_MAIN
{
 SetLanguage(LNGC_('E', 'N', 'l', 'E', CHARSET_UTF8));
 SetDateScan("dmy");
 //SetDateScan(t_("date-scan\admy")); // neither of these work
 MainGui().Run();
}
```

Still defaults to American style dates (although I like the dynamic background-colour changing when it sees a date it thinks is invalid - 02/29/2001 stays light red, but 02/29/2000 goes white...

although apparently century years don't count as leap years ;P).

What am I still doing wrong?

[edit]
BTW: Specifically, what's happening is that as I type a date (eg: 20/7/2006) into the EditDate gadget, it stays white, indicating a valid date... but as soon as I move focus away from the control by tabbing to another control or clicking away, the date immediately changes from "20/7/2006" to "07/20/2006" and the background colour changes to the "invalid date" colour. Then, I can't close the application without clearing the date field (or entering a neutral date such as 12/12/2006).

ps. Fudadmin, I agree that my offtopic problems with this widget would be better placed in say... the "problems with widgets" subforum or similar... bit late now though

[/edit...]

You need to SetDateFormat to your preferred settings also. Here's how I understand this to work: When you enter a date, its a 100% raw string. Then it uses DateScan to parse it into Year, Month, and Day internal variables. Then at some later point in time, it is formatted according to DateFormat. DateFormat takes the internal variables and puts it back into a string. This helps to make all dates similar, 1/1/06 would turn into 01/01/2006. It's just good measure. Then its saved. The problem is your DateFormat is not compatible to your DateScan.

Spot on - adding the missing SetDateFormat fixed it.

Changing the code to:
GUI_APP_MAIN
{
 SetLanguage(LNGC_('E', 'N', 'I', 'E', CHARSET_UTF8));
 SetDateScan("dmy");

```
 SetDateFormat("%3:02d/%2:02d/%1:4d");
 MainGui().Run();
}
```
Works perfectly. I'm a happy camper. Thanks Rbmatt and Luzr (and Fudadmin for moving this to a more useful place).

btw: I mentioned about the slowness of gcc's linker, but after switching to build with MSC8, the difference is striking - MSC8 seems to link about 10 times faster than gcc's ld! What the hell are they doing to take so much time...

Actually, the fastest combo around is still MSC7.1 - compiler is faster than 8.0 and good enough to compile all template stuff in U++ without problem.

I believe that MSC7.1 with U++/BLITZ is the fastest C++ compilation in the universe (Of course, as long as universe is limited in time and space so that parallel evolution somewhere else did not resulted in exact same C++ specification and better compiler writers
