Some people started using UWord for website creations..

So, I'm asking on their behalf.

How to insert and display *.png files in UWord and/or qtf?

1. case:

from upp web info:

@ @format:cx&cy

something like

[@ @image:cx&cy ...]

[@ @file:cx&cy ...]?

2. case:

or directly as hyperlink possible?

Thanks.

P.S. Not just Paste as sequence of bits but to save space for many insertions...

There is QtfRichObject that returns a special reference to contained RichObject as QTF string. Just do not forget to keep QtfRichObject alive during ParseQTF.

To create RichObject, consider using

RichObject CreateDrawingObject(const Drawing& dwg, Size dot_size, Size out_size);

```
RichObject CreateDrawingObject(const Drawing& dwg, Size dot_size, Size out_size);
```

Mirek

They are not C++ programmers! they are users...

something like this:

```
[s0; [C3*@B And now in the table: {{1:1 @@image::1500&500 logo1.png}} ] ] ?
```

```

I am confused. Users using QTF?!

Mirek

Whould you be less confused if I say that they are women and can't use C++?..

Ok, then tell please where is the button to insert an image in UWord (like hyperlink)?

Right now, the only possibility in UWord is to paste it.

Today I wanted to resolve the following problem for my program: I've a database from which I can

get information regarding name and country of the players. I've even a directory in which there are all the pictures of the flag associated with each country. I need to create badges for the players (info and the flag of their country). I thought to create a QTF document containing all badges. In this case the Aris' suggestion could be very useful to realize quickly this task. But maybe I must create an HTML file.

I guess, the simplest current way is to use CreateDrawingObject together with QtfRichObject.
