It looks teectrl Item doesn't have a var to store 32 bit data like Window's HTREEITEM'S LPARAM.

I'm using it to store 32 bit integers, but you can store anything in Value. See this page:

[http://upp.sourceforge.net/srcdoc\\$Core\\$UserValue\\$en-us.html](http://upp.sourceforge.net/srcdoc$Core$UserValue$en-us.html)

sorry,not ready yet,I used LPARA to store database record id in my MFC code,so I would to do the same thing in U++,but I found U++ TreeCtrl doesn't have such kind of variable.
btw,after I played with U++ a day,I really like it now,I create a simple GUI,build with MingW,optimized for size,upx the exe file,finally the size is 537kb.attach is the screenshot

if I didn't try,I never know U++ is so good!!!

Instead of LPARAM, in U++ you can associate TWO Values with each tree item.

First one is just stored (key). You can retrieve it later (e.g. for active item).

Second one is displayed in TreeCtrl. You can even define HOW it is displayed using the Display class.

You can directly store virtually any concrete type to the Value and you can make your own types "Value-compatible". Some of U++ Value-compatible types are String, int, double, int64, bool, Image, Color, Font, Drawing, Date, Time....

P.S.: Looking at the image you posted

- looks like U++ is able to support chinese in the end

- you are using 605 version ("stable"). There are many improvements in current "dev" version, maybe you could try it in parallel.
