
Subject: [Solved !] ide Complie Error when compiled under options other than "GCC32 Debug"

Posted by [3togo](#) on Wed, 23 Aug 2006 16:11:14 GMT

[View Forum Message](#) <> [Reply to Message](#)

I got compile errors below whenever I selected compile option other than "GCC32 Debug".

Any idea?

p.s I have forgotten to say thanks to all the developers. The ide now have a much better font rendering now.

3togo

```
 /usr/lib/gcc/i486-linux-gnu/4.1.2/../../../../lib/libX11.a(C onnDis.o): In function

Frankly, this looks like a problem INSIDE xlib.

I do not even know what Xau is... (but obviously, it is something xlib links in).

Are you sure you are linking against shared libs in release mode?

BTW, please, add your platform info when posting platform related messages (like linux distro, perhaps even gcc version).

I am using Ubuntu(Edgy) - GCC 4.1.2

However, the main point is not on whatever system I am using.

I did compile successfully as long as I am using "GCC Debug" mode.

Pardon me for being lazy to trace your code. Instead, could u mind telling me what is the difference between "GCC Debug" mode & say "GCC Optimal" mode given that "shared library" was selected while compiling under both modes.

3ToGo

Debug has `_DEBUG` macro defined (which is then `#ifdefed` to bring a couple of diagnostic facilities in), has not optimizations (compiler and linker flags) and has debug info active (again compiler and linker flags).

What exactly is causing that linker error is beyond my grasp...

By double-clicking "GCC-Debug" inside "theide", I did find out that the link mode for "Release Mode" is "static".

I therefore fixed the errors by adding the line below into ide.upp, recreating Makefile and then running make again.

```
library(LINUX !XLFD !SHARED) "fontconfig Xrender freetype expat Xau Xdmcp";
```

Thats really weird - that would mean that you have compiled in non-shared mode (!SHARED), otherwise this is inactive...

BTW, there are two "leveles" - SHARED and SO. Shared simply puts an option to linker to use shared `_external_` libraries, while SO also compiles packages as `.so`.

Another interesting thing is that I never met distro which would come with static version of `libxft`.

I am confused....

Actually I am using

`libfreetype6-dev` - FreeType 2 font engine, development files
instead of `libxft-dev`

Also for your information, my compiled ide(all static-Release version) is located inside the directory "GCC32-Gcc32-Gui-Linux-Main" and it's file size is around 8.5M

> 8503848 2006-08-24 03:22 ide

while my (shared -Debug version) is inside

"GCC32-Blitz-Debug-Debug_full-Gcc32-Gui-Linux-Main-Shared" with size around 6.5M

> 65353267 2006-08-24 03:28 ide

8.5MB and directory indicates static link. Shared would have Shared in there (btw, are these really "-" ? Should be ".").

freetype and Xft are different libraries.

In fact, Xft is library that combines XRender with Freetype.

Ok, I am loosing the track

I still believe that original (without patch) dev version should compile & link as shared release without changes you propose (if nothing else, there is still that !SHARED...)

Anyway, it is good to hear that it is possible to compile fully static version now.

I don't know why it simply works. Font rendering is surprisingly good.

I confirmed that without my suggested modification, your dev version works with both "release+shared lib" & "debug+shared lib" modes.

3togo

Hi 3togo,

I am very interested in the possibility to compile statically a package under Linux (Ubuntu 5.10) using the ide or a makefile. Please let me ask you if you have tried to compile statically some packages other than the ide; moreover I would like to know which setting (of the ide or of the makefile) you have used and eventually which libraries.

Thank you very much,
Luigi

I haven't compiled statically packages other than ide.

For details, u could refer to my Makefiles

http://www.arilect.com/upp/forum/index.php?t=msg&goto=4888&#msg_4888

Honestly, I have done it accidentally and my current linux distro is Ubuntu (Edgy).
