Hi.

How i can use "on_mouse_enter" event (or others)
for Button widget without inheritance of the
Button class ? ...using the callback system.

thanks.

You cannot

Use inheritance. You can however create your own derived button class that has
WhenMouseEnter callback.

The thing is that this case is quite special it it is not worth to add necessary code and data to each
widget....

Alternatively, there is a possibility of MouseHooks...
