Hello,

by right click on a row and then "delete row" I can delete the row of an arrayctrl. But I would like to inform the user about the data he deleted (I keep track of all his weird action to let him to come back).

There is no a specific WhenKillCursor to intercept the killing action to add my code. What to do? change the behaviour of DoRemove method? derive arrayctrl class? ...

Luigi

Actually, if you are about to do some action on Delete, it is as easy to implement your own local menu... (that is what I do).
