luzr wrote on Wed, 23 August 2006 06:08P.S.: Looking at the image you posted

- looks like U++ is able to support chinese in the end

- you are using 605 version ("stable"). There are many improvements in current "dev" version, maybe you could try it in parallel.

Mirek

yes,as you have seen,display chinese is ok with setting:"SetDefaultCharset(CHARSET_UTF8);"
TheIDE do has some thing not compatible with Chinese,include file choser and following attach:

As for problems with chinese glyphs in TheIDE - well, what is the situation with "monospace" fonts for glyphs?

TheIDE's LineEdit expects characters to be monospace and fit within monospace "cells".

Alternatively, perhaps you could post me some text in utf-8 chinese and perhaps the font you are using for it. (I know nothing about chinese and I do not in fact have any method how to try to enter chinese glyphs in TheIDE

well,in SQLite3,the default encoding is also UTF8,so if we have Chinese in the opening file path,we will fail to open the database,it says:"can't find the database file".that is same for U++,normally we use GB3212 or GBK encoding(same). there some code shows how to prefer the converting.

btw:one Chinese charater need two byte space

Do I understand well that GBK is the encoding of your filesystem in the "ASCII" mode?

yes,you get it,multibyte with 8th bit of some byte set to 1,
btw,where can I down the GridCtrl?

I was investigating a little...

Seems like GBK is extension to GB2312 and it is code page 936 in Win... Right?

Is there some _simple_ way how to perform conversion without using Win32 API (because of linux...)? I do not like the idea adding big conversion table... Alternatively, is there some way how to do that in Linux?

I have found this info:

Quote:

What Big5 encodes are particular graphical representations of characters or part of characters that happen to fit in the space taken by two monospaced ASCII characters.

Does it mean that "monospaced" glyphs in chinese occupy two character cells?

That would be hell to implement in TheIDE Perhaps I will have to find some alternate method (smaller font for chinese chars perhaps, to fit into cell).

That's right,BIG5,GB2312,GBK,maybe Japanese and Korea are in the same situation.I don't think it's a hell,you know,stringEdit can display input Chinese correctly,that means,U++ have the potential ability to deal with the East character. smaller font will make it look strange.

Well, the trouble is that LineEdit expects strictly monospaced font - all characters having the same width. All the code around LineEdit is based on this axiom...

Sure, for proportional editors, this is little problem.

Anyway, please send me some small UTF-8 encoded file with chinese glyphs to play with...

OK,I don't know if this right what you want,I copy some chinese character to notpad save as UTF-8.

Thanks, that is exactly I need

BTW, what is the unicode range for those "double-mono" spaced characters? (In other words, range for chineese glyphs..)

Another question: Is GBK needed in Linux too? Or they are wisely UTF-8 now?

Sorry,I don't know it so detail,but maybe this can help:

<http://www.unicode.org/charts/PDF/U4E00.pdf>

<http://www.unicode.org/charts/>

<http://www.unicode.org/charts/unihan.html>

<http://sourceforge.net/projects/fontmanager>

<http://sourceforge.net/projects/cce2k>

normally,youcan deal with CJK at the same way

Another interesting aspect - it looks like ideograms are in fact "monospaced" - is this observation correct? Or most of them?

That would be great as I could save a lot of memory for character width storage

Mirek

Mirek

yes, this is correct, for for CJK, using several bytes (normally 2) to index the ideograms, the ideograms are monospaced. such as 16*16 etc.

size.

FontSelector can't display the font name in Chinese:

that fix should be easy by Mirek
