---

I am trying to make "ide" by typing "make" on the terminal without using "theide" .

I found that I have to add the following lines to the top of CtrlLib/LabelBase.cpp before ide be successfully built from 608-dev2 under Ubuntu (Edgy).

```
#define IMAGECLASS CtrlImg  
#define IMAGEFILE <CtrlLib/CtrlLib.iml>  
#include <Draw/iml_source.h>
```

Please look into it.

Many thanks.

Have you made a fresh makefile export?

(makefiles are not maintained for dev versions...)

It is already a fresh Makefile. I guess it is an old problem about Makefile generator failed to recognize ".icpp" .

p.s.

By the way, may I suggest that "ide" should generate Makefile using relative address instead of absolute address.

e.g.

```
#UPPDIR1 = /home/jc/upp/uppsrc/  
#UPPOUT = /home/jc/upp/out/
```

UPPDIR1 = ../  
UPPOUT = ../../out/

Regards,

I would like to confirm that without the above fix my package is not compiled by the makefile. In the same time theide is not able to compile it.  
If the above fix is not applied, only theide can compile the package (607-dev1 under ubuntu)

Luigi
