I like upp and theIDE, though I cannot afford to switch the current dev environment (at least not on permanent basis).

So I started to "convert" some of the projects to Microsoft Visual C++ workspace (ie. sln and vcproj files).

Attached zip with working setup for several upp libraries and examples. I had to change several default settings to get it to link in release (ms linker was crashing otherwise, seems like a bug in the whole program optimization/link time code generation).

The project files are done against version upp-win-605 since at the time latest svn was broken.

Anybody cares to follow up with eclipse version?

-----  
An obvious fix fails of adding include into the "PixelUtil.h" fails with following error:

```
1>.\PixelFormat.cpp(927) : error C2065: 'SmartStretch' : undeclared identifier
```

and the definition of 'SmartStretch' I cant find anywhere.

So what gives?

Well, I am not sure what is going on, but PixelArray is 605 stuff, not present in latest sources.

Ok updating this post to the latest finding.

Older files are included in the svn but should not be used in the build. It was easier to build with 605 version since there

was more of one-2-one match between which (\*.cpp) files are in the directory and which ones are actually used.

Through trial and error i've resetup the workspace with the latest svn snapshot (among other things omitting the PixelArray.cpp) and now can build/run couple of the samples.

So will the unused files be removed from 'HEAD' revision or will continue to stay there?

ex: latest version (34)

<https://svn.sourceforge.net/svnroot/upp/uppsrc/Draw/> shows PixelArray.cpp which is not used.
