In TabCtrl,when I place one ctrl as one of it's page,there is a gap between page's frame and tabctrl's frame,how reduce the size of the gap?yes,maybe I can get the answer from TheIDE source,but I tried,it's too hard.
thanks

I am not sure I understand the question.

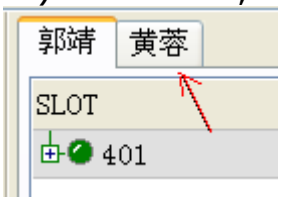

Anyway, the layout of TabCtrl is largerly dictated by XP theming API (plus necessary heurestics to make it work).

Mirek

Well, it is defined by chameleon metrics variable.

You should be able to adjust that by specifying your own metrics function with different MARGIN and calling TabCtrl::Style.

Mirek
is there any code to show how to specify such metrics function,why there no interface to set such parameter.

To conserve the space. I expect the style change to be not quite often; it is therefore better to hold single pointer to function rather than 16 integers.

OK, it is true that for TabCtrl this is non-issue, but I have actually used it as testcase for other Ctrls

(think about thousand of widgets in ArrayCtrl or TreeCtrl . I guess this is the way how to provide common cheap interface to deal with visual style changes. (Note that this is very recent stuff, chameleon was added 2 months ago).
