Is there any way to create primary key from more than one fields using schema files?

This not work..

```
TABLE_(TEST)
  INT_ (ID) PRIMARY_KEY
  INT_ (VERSION) PRIMARY_KEY
  ....
END_TABLE
```

If from any reason previous form would be hard to implement maybe form below would be easier..

```
TABLE_(TEST)
  INT_ (ID)
  INT_ (VERSION)
  ....
  PRIMARY_KEY (ID, VERSION)
END_TABLE
```

I didn't write it but I meant OleDb...

Anyway I found that in Oracle schema (as well as in Sqlite3) there is DOUBLE_PRIMARY_KEY macro.

I copied it to OleDbSchema.h and modified my sch file to look like this:

```
TABLE_(PERSON)
  INT_ (ID)
  INT_ (VER) DUAL_PRIMARY_KEY(ID, VER)
  STRING_ (NAME, 40)
END_TABLE
```

I removed all previously generated sql files (and table from db too) and run the test app. Now sql files have inside:

S_SQL-OleDb.sql

```
create table PERSON (
    ID            integer,
    VER           integer, primary key (ID, VER),
    NAME          varchar(40)
);
```

U_SQL-OleDb.sql

```
-----
create table PERSON (
    ID            integer
);
```

```
alter table PERSON add VER            integer;
alter table PERSON alter column VER    integer, primary key (ID, VER);
alter table PERSON add NAME          varchar(40);
alter table PERSON alter column NAME   varchar(40);
```

SD_SQL-OleDb.sql

```
-----
drop table PERSON;
```

Other generated files were empty.

Syntax of S_Sql-OleDb.sql is correct for ms sql server 2005. Unfortunately it seems like up always executes upgrade script which does not create primary key from two fields.

Code I use to perform schema changes:

```
Cout() << "Performing schema changes...\n";
SqlSchema sch(MSSQL);
StdStatementExecutor se(db);
All_Tables(sch);
if(sch.ScriptChanged(SqlSchema::UPGRADE))
{
    Cout() << "Upgrading...\n";
    OleDbPerformScript(sch.Upgrade(), se);
}
if(sch.ScriptChanged(SqlSchema::ATTRIBUTES))
{
    Cout() << "Attributes...\n";
    OleDbPerformScript(sch.Attributes(), se);
}
if(sch.ScriptChanged(SqlSchema::CONFIG))
```

```
{  
    Cout() << "Configuration...\n";  
    OleDBPerformScript(sch.ConfigDrop(), se);  
    OleDBPerformScript(sch.Config(), se);  
}  
sch.SaveNormal();
```

Because you do not execute it. Use SqlScheam::SCHEMA to execute the "schema" script.

However, I thing that adding dual primary keys (and maybe even single primary keys) should be the property of "ATTRIBUTES" script too. In other words, "underdevelopment". Could you fix that?

BTW, if you have better idea for dual key (and other multi-key) "syntax", do not keep it secret...

Mirek
