Hi!

I download it, re-compile theIde and works fine... except
This file TCtrlLib/appdoc.tpp/DlgCalc$cs-cz.tpp in package breaks the system. See
http://www.arilect.com/upp/forum/index.php?t=msg&th=1397 &start=0&.

Core/Local.cpp. I find it doing "find in files".

Clipboard in Linux doesn't work correctly. With himself not to find out in what conditions fail. It
seems that it uses clipboard private that communicates bad with the general.
See http://www.arilect.com/upp/forum/index.php?t=rview&goto= 5374#msg_5374

Nico

Have you recompiled it with "-fexceptions" as suggested and explained in that thread?

Nico

In the build method.

However, if you are able to rename or delete that topic file causing troubles, recompiling TheIDE using TheIDE you now have (dev2) should be equivalent (that parameter is now stadard for GCC builder).

I'm sorry, but find "build method" by any part, is not that I am new

I don't know how add special options to gcc.

Nico
