I am proud to announce that U++ reached another milestone:

We have now a new designer for .iml files, supporting alpha channel. It is generally much more advanced tool, with simple but effective supersampling mode (to get that alpha..), tools as blur/sharpen, color adjustments, non-rectangular selections etc...

With it comes a new .iml format supporting alpha channel, however this time everything should be smoothly backwards compatible - despite the fact that the new format is completely different, based on zlib compression.

Also, as a result of this compression, U++ .exe size is down again - e.g. TheIDE is now good 0.5MB shorter (also result of much leaner code of the new IconDes).

Please help us betatest this new tool - it should be included with new dev release.

The IconDes header and implementation file are missing from 610-dev1. Please update the sources or at least update SVN with the new sources.

Thanks.

Admirable work.
Thank you for creating such a wonderful framework, really
