// codes extracted from src/main.cpp

```
GUI_APP_MAIN
{
```

```
    TrayIcon traywindow;
    App app;
```

```
    traywindow.Run();
    //Ctrl::EventLoop();
```

```
}
```

If traywindow.Run() is used, all the events from traywindow could be processed but all the events from app was ignored.

If Ctrl::EventLoop() is used, app events is now be processed but not traywindow.

I have attached the source codes and below is the procedures to "make" the codes:

```
tar jxvf trayicon20061005.tar.bz2
cd trayicon
make
./traytest
```

Window must be open to process messages.

If I open a window using `OpenMain /Open`, it will end up create a new window. I need a way to link my newly created "Tray Window" to windows created by `TopWindow`.

I am now still puzzling on how to cast my own version of "Tray Window" to become a real `TopWindow`. I need something like

`GtkEventBox`

`GtkEventBox` — A widget used to catch events for widgets which do not have their own window

I think you should follow basically the same path as `TopWindow` - derive from `Ctrl` and use X11 specific stuff to bring the widget to the system.

It is quite possible that in the process you will need to fix `X11Wnd.cpp`, perhaps adding some `Create` parameters. I think for low-level stuff like this it is OK.
