Hi,

before i start to write a U++ Postgres plugin, i would like to ask if anybody is still writing on it?

with best regards

peter

simple cache for prepared statement. i'm gonna change it to fit the U++ design.

Why doesn't have Commit, Rollback and ... methods a return value like execute? The user cannot see if Commit or Rollback failed.

with best regards

Peter

Well, I think that failing Commit or Rollback are equivalents of hardware failure - best you can hope for is nice panic message and application termination.

I don't think so. The user can decide after an error to switch to a second database or store all values in an emergency file for later restore into database.

I think it would not be amiss if Commit, Rollback and ... has a return value.

with best regards
Peter

Might be true for Commit, but Rollback?

Mirek
