Hello,

today is not my day. All SQL stuff does not work. Even the SQLApp has problem. Am I missing something?

Luigi

```
=====
query.cpp
C:\upp\uppsrc\CtrlLib/EditCtrl.h(130) : error C2248: 'Ctrl::operator =' : cannot access private
member declared in
    class 'Ctrl'
        C:\upp\uppsrc\CtrlCore/CtrlCore.h(260) : see declaration of 'Ctrl::operator ='
        C:\upp\uppsrc\CtrlCore/CtrlCore.h(190) : see declaration of 'Ctrl'
    This diagnostic occurred in the compiler generated function 'EditField &EditField::operator
    =(EditField &)'
SQLApp: 1 file(s) built in (0:02.43), 2438 msec / file, duration = 2453 msec
```

---

Perhaps I need to upgrade the plugin as explained in  
<http://www.arilect.com/upp/forum/index.php?t=msg&th=1203&start=0&>

had the same Problem, solved it by changing the line  
query.borrowed\_from = query.borrowed\_to = Null;  
to  
query.borrowed\_from = Null;  
query.borrowed\_to = Null;  
in File "examples/SQLApp/query.cpp" function "void SQLApp::ClearQuery()"

Bas

Thanks Bas,

Now it works and I can start to learn sqlite.

I found One small error in SQLApp.

In file book.cpp, line 35, I change

```
SQL * dlg.ctrls.Update(BOOK);
```

with code

```
SQL * dlg.ctrls.Update(BOOK).Where(ID == q);
```

Without this, I can't be able to change BOOK table.

Thanks.

Thanks. And Sorry for my English.

Now (this time) I try to understand technique (or technology) of life with UPP and I have additional time to analyze examples.

I found this TOOL is interest and powerful.

And I found one more strange thing in this example.

File borrow.cpp, lines from 14 to 27 - Function

```
Value DateIntConvertCls::Scan(const Value& text) const
{
    String txt = text;
    if(IsNull(txt))
        return Null;
    Date d;
    if(StrToDate(d, txt)) {
        const char *s = txt;
        while(*s == ' ') s++;
        if(*s == '\0')
            return d - Date(1970, 1, 1);
    }
    return ErrorValue("Invalid date!");
}
```

I add there one string return d - Date(1970, 1, 1);.

Value DateIntConvertCls::Scan(const Value& text) const

```
{
    String txt = text;
    if(IsNull(txt))
        return Null;
    Date d;
    if(StrToDate(d, txt)) {
        const char *s = txt;
        while(*s == ' ') s++;
        if(*s == '\0')
            return d - Date(1970, 1, 1);
    }
    return d - Date(1970, 1, 1);
    // ~~~~~
    return ErrorValue("Invalid date!");
}
```

Without this string, I can't to edit Date fields, when I add borrow records. I can add only empty dates.

This may be my mistake or mistake of program.

SQLApp - is a complex example, because many of newbies see to this application and this application is face of system.

And this app must be a example of stability ( ).

Now (this time) I try to understand technique (or technology) of life with UPP and I have additional time to analyze examples.

I found this TOOL is interest and powerful.

And I found one more strange thing in this example.

File borrow.cpp, lines from 14 to 27 - Function

Value DateIntConvertCls::Scan(const Value&amp; text) const

```
{
    String txt = text;
    if(IsNull(txt))
        return Null;
    Date d;
    if(StrToDate(d, txt)) {
        const char *s = txt;
        while(*s == ' ') s++;
        if(*s == '\0')
            return d - Date(1970, 1, 1);
    }
    return ErrorValue("Invalid date!");
}
```

I add there one string return d - Date(1970, 1, 1);.

```
Value DateIntConvertCls::Scan(const Value& text) const
{
    String txt = text;
    if(IsNull(txt))
        return Null;
    Date d;
    if(StrToDate(d, txt)) {
        const char *s = txt;
        while(*s == ' ') s++;
        if(*s == '\0')
            return d - Date(1970, 1, 1);
    }
    return d - Date(1970, 1, 1);
    // ~~~~~
    return ErrorValue("Invalid date!");
}
```

Without this string, I can't to edit Date fields, when I add borrow records. I can add only empty dates.

This may be my mistake or mistake of program.

SQLApp - is a complex example, because many of newbies see to this application and this application is face of system.

And this app must be a example of stability ( ).

Stupid me. That is the price to pay when you are overengineering the code, and not test it enough in the same time...

```
Value DateIntConvertCls::Scan(const Value& text) const
{
    String txt = text;
    if(IsNull(txt))
        return Null;
    Date d;
    if(StrToDate(d, txt))
        return d - Date(1970, 1, 1);
    return ErrorValue("Invalid date!");
}
```

Thanks!

One more small question.

Of course, I can find the answer himself.

---

In russian standarts Date fields must start from day, followed by month, and at end must be year.  
And .(period) must be as divider.  
(for example 29.12.2008)

May be exist ready solution to make Date Entry field under our standards.

Thanks.

---

Yes. You have to switch to

`SetLanguage(LNG_('R','U','R','U'))`

at the start of program.

sergeynikitin wrote on Sat, 26 January 2008 04:11 So simple???

I hope so Should work, as long as RURU translator did the job right

(BTW, if you have a bit of time, you should provide the update of translation, see annoucements).

All the works. Regarding translatings, I am still in the process of learning. I have a lot of plans for the programming in environment TheIDE. As a result, there is a lot of translations, which I will publish.

Hi Mirek.

One more error in SQLApp.

In file query.cpp.

When we enter dates, then deferent dates format is used in SQL and in screen vars borrowed\_from and borrowed\_to.

in SQL - number of day from 1/1/1970 and in vars - in other format.

Therefore, if you really try, you will not succeed.

Sorry that I twisted for this example.

(I am trying to understand the code and do not understand. Nested see in the screen. Finally I understood it - there is a mistake!!! )

.... continued previous message

I think.

A code should look something like this.

```
void SQLApp::Query()
```

```
{
    SqlBool where;
    SqlSet borrowed = Select(BOOK_ID).From(BORROW_RECORD).Where(IsNull(RETURNED));
    int q_date_from = ~query.date_from - Date(1970, 1, 1); // <== NEW
    int q_date_to = ~query.date_to - Date(1970, 1, 1); // <== NEW
    if(query.status == 1)
        where = ID != borrowed;
    if(query.status == 2)
        where = ID == borrowed;
    SqlBool bdate;
    if(!IsNull(query.borrowed_from))
        // bdate = BORROWED >= ~query.borrowed_from;
        bdate = BORROWED >= q_borrowed_from; // <== NEW
    if(!IsNull(query.borrowed_to))
        // bdate = BORROWED <= ~query.borrowed_to;
        bdate = BORROWED <= q_borrowed_to; // <== NEW

    if(!bdate.IsEmpty())
        where = where && ID == Select(BOOK_ID).From(BORROW_RECORD).Where(bdate);
    book.Query(where);
}
```

It is not "transfer", but "translation". Post it to i18n forum.
