[View Forum Message](#) <> [Reply to Message](#)

Hi!

I have done a 'TrayIcon-Application' and want to use a SetTimeCallback, but I'm getting an error during compiling the application.

C:/UPP_610/uppsrc/CtrlCore/CtrlCore.h:963: error: `void Ctrl::SetTimeCallback(int, Callback, int)' is inaccessible

I thought TrayIcon is inherited from Ctrl, so why I cannot access SetTimeCallback? If I use the 'Class Browser' I can find SetTimeCallback in TrayIcon class.

Anything I did wrong?

Thanks for any tips or help.

have you seen this message:

http://www.arilect.com/upp/forum/index.php?t=msg&goto=3880&#msg_3882

there is a blinking label with TimeCallback, maybe that helps

Hi Bas!

Thanks for the link, but this is inside a Ctrl where it also works for me. I have used it in this way many times, but now I have a class inherited from TrayIcon and then SetTimeCallback seems to be not available. Even TrayIcon is inherited from Ctrl, so in my logic it should work, but I'm just a beginner in U++ and so most likely I did something wrong.

This is from the class declaration:

```
class MyClass : public TrayIcon {
public:
    typedef MyClass CLASSNAME;
    MyClass();
private:
    void OnTimer();
```

Then this in my constructor:

```
SetTimeCallback(1500, THISBACK(OnTimer));
```

And I get this error during compiling:

```
C:/UPP/uppsrc/CtrlCore/CtrlCore.h: In constructor `MyClass::MyClass()':
C:/UPP/uppsrc/CtrlCore/CtrlCore.h:936: error: `void Ctrl::SetTimeCallback(int, Callback, int)' is
inaccessibl
e
C:\MyApps\MyClass\main.cpp:17: error: within this context
C:/UPP/uppsrc/CtrlCore/CtrlCore.h:936: error: `void Ctrl::SetTimeCallback(int, Callback, int)' is
inaccessibl
e
C:\MyApps\MyClass\main.cpp:17: error: within this context
C:\MyApps\MyClass\main.cpp:17: error: `Ctrl' is not an accessible base of `MyClass'
```

Any ideas how to get it working?

Well for a fast hack change the line
class TrayIcon : private Ctrl
to
class TrayIcon : public Ctrl
then it should work.

@others

Why is Ctrl a private base-class of TrayIcon? I guess to hide some functions like SetRect etc - in that case it would be great to add SetTimeCallback to TrayIcon.

Hi!

Thanks for the hint. Seems I was a bit blind and overlooked that Ctrl is inherited as private.

Bas

Because Ctrl is used just as implementation helper. TrayIcon really is not Ctrl.

So SetTimeCallback won't work with TrayIcon at all?

Well, ::SetTimeCallback would. But I recommend using TimerCallback, which can be considered "highest level" version.

Trouble with ::SetTimeCallback is that you are responsible for killing callbacks in destructor (otherwise timer would call dangling callback).

Hi Mirek!

Thanks for the explanation. I tried TimeCallback and it works fine for what I want to do.

Just to highlight in case somebody reads through the thread again. The class is TimeCallback not TimerCallback.
