How do you declare a global Sql sql instance?

Why do I need this? I want to speed up a very long process by executing just one query and my SetTimeCallback function will just fetch it from the global sql.Fetch().

I tried to declare a global Sql sql and attach the session by sql = Sql(session), but it exits the program.

Are there any other approach other than populating global Vectors or Arrays, such as Sql iterators?

Thanks,

Laurice

```
Hi,
In Sqls.h is on line 211:

struct AppSql: Sql {
  void operator=(SqlSource& s) { Assign(s); }
  AppSql(): Sql(NULLSQL) {}
};
AppSql& AppCursor();
#define SQL AppCursor()

And in Sql.cpp is written on line 404:
GLOBAL_VAR(AppSql, AppCursor)

Try used SQL as global instance.
```

It is only my observant. Maybe i'm wrong.

Can you give a short code snippet on how can I use this SQL macro?

```
I'm using something like these two functions to open and close sqlite database file:
void OpenDB()
Sqlite3Session &sql_session = Single<Sqlite3Session>();
#ifdef DEBUG
sql_session.LogErrors(true);
#endif
if(!sql_session.Open(ConfigFile("data.db"))) {
LOG("Can't create or open database file\n");
 return;
}
// This is global:
SQL = sql session;
void CloseDB()
Single<Sqlite3Session>().Close();
}
And in code I query database this way:
Sql sql;
sql * Select(SqlAll()).From(SOME_TABLE);
while(sql.Fetch()){
//Do something
 Value some field = sql[SOME FIELD];
```

Interesting, why two functions and Single?

In my apps, I open DB in GUI_APP_MAIN and let destructor to close it.

```
GUI_APP_MAIN {
    Sqlite3Session s;
    if(!s.Open(...)) ...
    SQL = s;
    ..run the app...
}
```

I implemented this, because in my app, I have to close and open databases while the app is running. But SqlSession interface, that I can get from the global SQL, has no Open() method to open sqlite3 session.

That explains it... (but in that case, I may rather used Sqlite variable instead of Single and just Open - it should close the previous connection first, at least that is how U++ classes are expected to work....).

I don't undestand this. I use Single, because the session have to be live in memory. If I create an

Sqlitee3Session on the stack and Open() it, it will be destroyed at the end of the method. Or do you mean, that using a global Sqlitee3Session is better than single?

Sometimes. But I rather had in mind member variable.

Anyway, solution with Single is OK as well. Just that Sqlite is not the typical singleton class

great, modified the source code with SQL, and works like a charm.
