Just wondering if it is possible to delete tabs on the fly to dynamicly grow and shrink the number of tabs as needed. I looked at the built in functions for TabCtrl and did not see anything obvious.

Thanks,

Dave

Hi Dave,

as far as i know that is not possible - you have to delete all of them (myTabs.Reset())and add them again without the one you want to delete.

Thanks Bas,

That will work.

It's very uncomfortable.

Luzr, could you please add functionality for individual tabs removal?

You may want to look at the QuickTabs from Thelde. See [uppsrc/ide/quicktabs](#)

Thanks, added to my project. It's a good solution for tabs, but I haven't found how to handle it's events - on user's creating, switching, deleting tabs.

::up::

Anyone who used QuickTabs, could you please tell how to handle opening, closing and swithing tabs of QuickTabs in app?

Yes.... anyway, you might try it yourself (I think it is not that complicated) and post a patch

Added TabCtrl::Remove(int n) method. But didn't have time for complete testing, for now it seems to work for my application.

```
bool TabCtrl::Remove(int n)
{
    if (n >= tab.GetCount())
        return false;
```

```

if(tab[n].ctrl)
    tab[n].ctrl->Remove();
if(tab[n].slave)
    tab[n].slave->Remove();

tab.Remove(n);
if (tab.GetCount())
    Set(sel ? sel-1 : sel);
else
{
    x0 = 0;
    CancelMode();
    sel = -1;
    accept_current = false;
    WhenSet();
}
SyncTabs();
Refresh();
return true;
}

```

Also, I propose adding WhenSet() call to TabCtrl::Reset() for it just changed selected tab index to -1. It would be more convenient for user to have one uniform handler, than explicit code going right after Reset() in user's application code.

OK, I have altered it a bit and added to uppsrc.

The most important change (apart from some detail bugfixes) is removal of the first condition. IMO, putting wrong index here is program logic error and should not be implicitly hidden...
