I installed 612dev1, then create console application (no U++).
Just after created, i create basic ctrlib type application.
Then when i want to set main package to my console application, i didn't see it, unless i check 'All packages' option.

Is this only me?

Thanks

This is a bug in "Console.upt". (I informed Mirek about it.)

Do as follows:

1.
Check "All packages" to make your project visible, select your package, and press "OK".

2.
Left-click on "Main configuration:" (the entry field in the tool bar after "Paste" = 4th field from left).

3.
Right-click on the view area of the "Main package configuration(s) window".

4.
Select "Append row".

5.
Without entering anything just press "OK".

From now on your package should behave as all the other packages.

Werner
