I need xml-rpc calls and implemented a client.

For this i needed a Map with at least the data beeing Value so i wrote the ValueMap (pretty much a copy of ValueArray with some changes).

And to test it i have RpcTest, a small App to execute xml-Rpc calls at some servers.

Suggestions etc are welcome, have fun.

Bas

[edit:] see <http://www.xmlrpc.com/spec> or <http://en.wikipedia.org/wiki/XML-RPC> for more informations about xml-rpc

Cool!
My favourite line is:
`http.AddHeaders(xml);`
Good idea for POSTing xml as body

`http.AddHeaders(xml);`
Good idea for POSTing xml as body

thanks

uploaded some changes (at the first post)

RpcTest:

- * added the button "check for methods", which calls the "system.listMethods" function on the listed server and inserts them into the DropDownList of method
- * added the server value at the bottom, which parses the call that is sent

XmlRpc:

- * removed a Bug that came up when a struct contains a struct as value
- * implemented ParseMethodCall(String s)

ValueMap:

- * only Core-Package is added as dependency

usage:

1. choose a host, path and its port and push "check for methods" if the server supports it the methods will be in the drop down of method
2. choose a method (or enter it) and add Param(s) as needed
3. press "execute" and have a look at the answers:

- sent is the xml data sent to the server
- reply is the raw xml data received from the server
- client is Value.ToString() of the Value returned by XmlRpcClient::Execute(XmlRpcCall c)
- server is Value.ToString() of the Value returned by XmlRpcParser::ParseMethodCall(String s)

for the ones of you interested in XML RPC:

have a look at www.fallingdutch.de

the current version of XmlRpc, ValueMap and RpcTest are there, including a doxygen documentation of XmlRpc

[edit:] added sample server, too
