Hi,

it seems like Matthias Sund has endless problems logging into the new forum. He says

Quote:
I captured network data with a sniffer and I saw a HTTP response of type 200 which is OK, but the response is a chunked one (Transfer-Encoding: chunked) and the received chunk is empty. So firewall seems to be ok and a content filter is also not active.

Does this ring a bell in anybody?

If anobody else has problems too, please contact me at

cxl@ntllib.org

Mirek

Hello, I access the forum once or twice times every day and don't have problems up to now.

Hi Mirek,

it is working, now.
I am able to login and post messages, great !
I have a different forum default theme, but that seems to be the only difference.

Matthias

So the theme was the problem?

I am not quiet sure, but since I did not change anything on my setup and since I got the problem on every system I checked, it is highly probable that this was the issue.
So I leave my account with default forum theme to avoid future problems.

Matthias

The registration confirmation e-Mail seriously needs at least a sentence stating where the registration link hooks. My initial response to the conf. e-Mail when I registered was that the e-Mail was spam.

A link and some letters like cfx and such doesn't really tell anybody anything about what they're going to click. In this current day and age there are a lot of links out there that want to hurt ya'.
