I'm positive this was asked before, I just couldn't find it through forum search.

What I want is this: Have a top window, and inside it containers, which contain other widgets.

The problem I have, is that the springs can only position relative to the containing window.

Suppose I want 2 buttons to move together. The first thing that comes to my mind, is that I create an invisible container, which moves relative to the main window, and add the 2 buttons to the container, which move relative to the container.

How can I achieve this?

Exactly as you suggest

The only problem is that Layout designer is not designed for "nested" operation. If you want to design this in Layout designer, you will have to use two layouts (one placing container to TopWindow, other for container).

BTW, the class intended for use as such container is ParentCtrl.

Heh, I didn't need this after all

To be honest, what I wanted, is to put 2 buttons into the middle bottom of a resizable dialog, and make them stay in the middle, with a fixed gap between the buttons, when the user resizes the dialog.

I simply achieved that by making a "Fixed Bottom" spring for both buttons, and make the rest turned off.

Still need to fully grasp the concepts...
