hello these last days in year...

I have different repositories with different version of used shared libraries and includes in my project.

let's say /usr/libs1 and /usr/libs2

building two different versions of project, for one version I use first case (/usr/libs1), for other second...

how to achieve this, when need to change these directories often?

thank you and have a good next year of lots of accomplished wishes...

I hope I understand you well that we are speaking about libraries, not U++ packages here...

I think the easy way is to define more build methods. Go to Setup/Build methods, right-click the

method you are using now and choose "Duplicate row". Then adjust header / library paths to your liking...

I am not sure what "local path" is in this context.

---

well, a little investigation helped:

[http://www.network-theory.co.uk/docs/gccintro/gccintro\\_21.html](http://www.network-theory.co.uk/docs/gccintro/gccintro_21.html)  
and  
[http://www.network-theory.co.uk/docs/gccintro/gccintro\\_23.html](http://www.network-theory.co.uk/docs/gccintro/gccintro_23.html)

so, -I and -L first, then standart gcc paths, then env paths

thanx
