I wish to calculate an md5 hash with a MASM module written myself.
How i can use the MASM function ("\$ GetMD5 [file(s)]") in u++?

thanks a lot

Maybe you shoul check first whether your version is faster than one provided with U++ (in Web package)

U++ does not directly support assembler. But you coould add it as library, as standalone object file or as .asm in package and use custom build step to compile.

Hey thx!
I would have to use my asm code for not increment my app size adding a pack... howewer can you explain me where is md5 function in Web pack and how to use it?
thankyou very much !

Ok Ok maybe I solve it...
I find MD5Digest() function and works correctly but I've two question:

- char hello[6] = "hello";

String Test = MD5Digest(hello,0);

return a strange string without number or char only symbols... I understand that I've to encode it, maybe ascii but how?

- How I can retrieve MD5 hash from a file?

THX A LOT!

You can use BinHexEncode() for encoding.

- How I can retrieve MD5 hash from a file?

AFAIK MD5Digest(LoadFile(myfilepath), 0);

THX GUYS IT'S WORK PERFECTLY!!!

hehe another two things...

I need to show an open file dialog or something similar to retrieve file position

How I can assign a textbox's text to a variable (string)?

Really thx to all and sorry for my U++ gaps .

cheers

```
String s = your_control.GetValue().ToString();
```

Is the same use in an EDITSTRING control "GetText().ToString()"?
Thx!

what is the the second parameter in MD5Digest(char,int)?
I see that if I change it from 0 to 16 my hash code change...

I use this function:

```
void MD5::DoBrowse()
{
    FileSel fsel;
    fsel.AllFileType();
    static String recent_dir;
    if(fsel.ExecuteSelectDir())
        File_Path <=& recent_dir = ~fsel;
}
```

where File_Path is a TextBox...

My problem is that return only the directory and not the exe why?
Can you fix it for me?

thx

ExecuteSelectDir is for selecting directory. Use ExecuteOpen to select file.

"GetText().ToString()"?
Thx!

Usually, the best method is to use operator~, which is equivalent to calling GetData.

String s = ~myeditfield.

Of course, type stored in widget has to match (int x = ~myeditstring; is runtime error).

Thx, I solve all... but
can you explain me what is the second parameter in MD5Digest()?

thx for your patience!

Gatling_Gun wrote on Sat, 06 January 2007 08:28Thx, I solve all... but
can you explain me what is the second parameter in MD5Digest()?

thx for your patience!

```
String MD5Digest(const char *text, int length);  
inline String MD5Digest(String s) { return MD5Digest(s.Begin(), s.GetLength()); }
```

If still unclear:

There are two versions - first one is for raw binary data, second one is for String. If used with
binary data, you have to supply how much data is there. String has this information inside.

OK, now the somewhat confusing part is that String can be constructed from (zero terminated)
const char * and converts to (zero terminated) const char *....

Anyway, the simple thing to do is to avoid second parameter.

Tanks I solve it simple avoiding that parameter...

Thanks to all guys!
