For some time I was thinking about adding something like this container to U++ Core:

```
template <class T>
class Order {
    Vector<T> data;

public:
    int Find(const T& x);
    int FindAdd(const T& x);
    void Add(const T& x);
    const T& operator[](int i) const { return data[i]; }
    int GetCount()           { return data.GetCount(); }
};

template <class T>
void Order<T>::Add(const T& x)
{
    data.Insert(FindLowerBound(data, x), x);
}

template <class T>
int Order<T>::Find(const T& x)
{
    return FindBinary(data, x);
}

template <class T>
int Order<T>::FindAdd(const T& x)
{
    int i;
    i = FindUpperBound(data, x);
    if(i && data[i - 1] == x)
        return i;
    data.Insert(i, x);
    return i;
}
```

basically, sorted array used as associative container.

- advantage: less data used, so it could be useful for storing small maps.
- disadvantage - gets slow if there is too much data inserted (Insert slows it down).

Today I decided to put the disadvantage to the test and benchmark it against tree (std::set).

To my surprise, if we consider rather unlikely 2:1 find:insert ratio, this trivial implementation keeps the pace with std::set up to about 2000 elements! I am surprised.

Mirek

P.S.: Does not mean that Order will be part of U++ Core soon, it was just experiment...
