
Subject: Project files for MS Visual Studio
Posted by [Novo](#) on Tue, 06 Mar 2007 05:47:16 GMT
[View Forum Message](#) <> [Reply to Message](#)

I've made project files for MS Visual Studio and tried to compile them. Unfortunately I couldn't compile many projects including Core because of various problems. See below.

d:\home\sergey\cpp\code\GUI\upp\2007.1rc2\uppsrc\ide\VectorDes\IdeVectorDes.h(4) : fatal error C1083: Cannot open include file: 'VectorDes/VectorDes.h': No such file or directory

Para.cpp(1) : fatal error C1083: Cannot open include file: 'NText.h': No such file or directory

Locale.cpp(4) : error C2143: syntax error : missing ';' before '<'

Last message seems to happen because Locale.cpp doesn't belong to the UPP namespace.

Is that a problem with UPP, or it is my fault?

I'm using 2007.1rc2.

Thanks.

P.S. There are newer versions of project files below.

BTW. I'm reporting bugs.

For example, there is no such file as VectorDes.h

Subject: Re: Project files for MS Visual Studio

[View Forum Message](#) <> [Reply to Message](#)

I've removed projects that are under development and fixed others.

There is one problem left in project Ole_Ctrl:

util.cpp(466) : error C2664: 'LoadTypeLib' : cannot convert parameter 1 from 'Upp::WString' to

'const OLECHAR *'

No user-defined-conversion operator available that can perform this conversion, or the operator cannot be called

I've also put "using namespace UPP;" into OleCtrl.h in order to be able to compile it.

A result is attached.

I can prepare project files for the whole UPP if somebody needs them. I can also build project files for vc8, bds4, cc, em3 and ghs

Sounds good. Do you think it is a good idea to publish those as sf.net downloads? Do you want file release priviledges?

Mirek

I think it is a good idea to support multiple development environments. Publishing of project files for msvc and other IDE would attract people to UPP.

Release privileges at sf.net would speed up the process.
But I steel need a few day to prepare first version.

Thanks.

First release-candidate for vc71

190 projects.

Everything compiles ...

Have fun.

When I run applications compiled using my vc project files I'm getting Look&Feel like on the attached image. Actually, everything is flattened. When I push the "Host" button everything returns to normal.

I'm definitely miss something ...
Could somebody explain to me what exactly I'm missing?

Thank you.

I think .icpp is the cause. Frankly, not quite sure how to resolve this problem in Visual Studio.

Mirek

There is still no handling for icpp files.
Actually, I can fix these project files manually. (I would limit myself with 33 main project files.)

About the maintenance of a "port".

I cannot promise that I will do this forever, but because everything (project files) is generated automatically, everybody can do that when I'm gone.

I'll prepare new project files, probably, next weekend.

EBo --

It is a tricky question. I can write a MSVC project generator. I even wanted once. But I do not want to do this the way TheIDE does.

The makefile generator from TheIDE is hard to extend and support.

I'm using MPC because I like very much ideas it is based on.

Domain-specific language + template engine. That is it.

The only drawback of MPC is perl.

If you need a makefile generator in stile of TheIDE you can take a look at CMake (<http://www.cmake.org/HTML/Index.html>).

Subject: Re: Project files for MS Visual Studio
Posted by [ebojd](#) on Wed, 11 Apr 2007 11:50:06 GMT
[View Forum Message](#) <> [Reply to Message](#)

If I recall correctly, CMake is not a makefile generator, but a build system in itself. As I understand it, the makefile generator generates Makefiles from the .upp project description. It still depends on the system installed build facilities. So, I think of this as basically an export the build directives to ***

Sorry for the delay with the answer.
I've tried your approach. For some reason it doesn't work for me. You set "C/C++ Compiler Tool" as a tool for an icpp file. I couldn't find where you link against a compiled file.

I even went further. I explicitly link against an object file (check Debug configuration in vc71 project file attached below). That doesn't help either.

Somewhat improved project files are attached below.

Sorry for a long disappearance.

<http://www.cmake.org/HTML/Features.html>

"Generates native build files (e.g., makefiles on Unix; workspaces/projects on MS Visual C++). Therefore standard tools can be used on any platform/compiler configuration."

As I recall, project file generator in CMake is hardcoded into the code. It is just a bunch of print statements. So, you cannot fix anything without changing the code. That seems to be a bad idea (at least to me).

You need to put it as library input for the output project (the one that produces *.exe)

Hi I tried using your VC8 project files to build upp. Most projects built fine but the following fail:

MySql

c:\upp\uppsrc\mysql\MySql.h(12) : fatal error C1083: Cannot open include file: 'MySql.h': No such file or directory

Geom_Coords

c:\upp\uppsrc\geom\coords\GeomCoords.h(5) : fatal error C1083: Cannot open include file: 'TCore/TCore.h': No such file or directory

SqlCommander

c:\upp\uppsrc\geom\coords\GeomCoords.h(5) : fatal error C1083: Cannot open include file: 'TCore/TCore.h': No such file or directory

I dont seem to have a C:\upp\uppsrc\Tcore directory, should I?

I'm not going to be using any SQL stuff in the foreseeable future so I can omit those projects from compilation. Can I omit GeomCoords?

Any ideas? This toolkit looks really cool and I'd like to try it but at the moment it doesn't look promising.

Well, these are most likely bugs in U++, however, mostly irrelevant - you are trying to build sources here that got to the release by mistake ('release' is sort of selection of packages from larger codebase).

OK, one question (I have not followed this thread in detail recently...):

Is the .icpp problem resolved to the degree that "MSVC version" would become a part of regular U++ releases? (Downloadable on sf.net)?

Would providing some sort of separate .lay, .iml files editor and .tpp directory editors sense? (In fact, all we need here is just modified theide startup sequence so that it directly edits the file...).

Subject: Re: Project files for MS Visual Studio
Posted by [dskips](#) on Sun, 01 Jul 2007 00:49:29 GMT
[View Forum Message](#) <> [Reply to Message](#)

Novo provided a VC8 solution file and 29 project files. Each project is a part of the source the projects are Core, Crypto, CtrlCore, CtrlLib, Draw etc...

Ok, I can do with SQL so i'll leave that out of the compilation but do I need geom_coords? The files are GeomCoords.h method.h coords.cpp ellipsoid.cpp method.cpp and util.cpp.
If I do need these how can I go about fixing the release?

Subject: Re: Project files for MS Visual Studio

Without TheIDE that recognizes .lay and .iml files, you will need some way to edit them...

Why not associate theIDE with .lay and other files so double click in VS would start up as the editor?

linking against .obj file corresponding to *.iccp would be acceptable solution since it does not rely on specific VC++ extensions.

If *.iccp file compiled into the library (as a regular cpp) the linker will drop the object code from them since they are not referenced inside the library itself.

theIDE has a work around for this, but to make it work with other IDE's one would have to use non-standard extensions to force the linker to reference the code in iccp file. Snapshot for VS2005 attached. (Is it not?)

Another approach is to link with *.obj files corresponding to *.iccp with the target executable....

I've played with "Force Symbol References" in VS 7.1. I've set it to ?CtrlSetDefaultSkin@Upp@@@YAXP6AXXZ0>@Z . No luck at all. Got the same flat gray interface.

I don't think many people will want to link their applications against Core_init.obj, CtrlCore.obj, CtrlLib.obj, Oracle_init.obj, e.t.c in addition to appropriate static libraries.

IMHO it is just a bad idea to use special linking rules instead of explicitly referencing symbols in iccp files. It is just a bad practice. Trying to solve that problem is just waste of time.

Ultimate++ is either usable with Visual Studio or not. At this particular moment it is not usable. (Of course, you can explicitly call SetSkin(ChHostSkin) in your application as I did.)

The real point about .icpp is that it "registers" packages that are in the project. E.g. if you add
some image codec (like plugin/png), .icpp is used to register it to the global codec map.

Obviously, the set of .icpp is variable and depends on what packages are used...

The one possible solution would be to add init routines solely for use with MSVC. Of course, it is
inferior solution.

Mirek
