I am getting an XmlError that states "invalid character data". What does this mean? When does thie error occur?

Also, please update your documentation to include the XML functions. The examples really are not good enough. I had to test each function in order to try to figure out what it did.

I have some experience with XmlParser but please provide sample XML and sample code then I might be able to help you.

The error only happens some of the time. There is a dynamically generated XML string coming from another program and most of the times it processes just fine. Some of the times though, i get the error.

Unfortunately, I cannot provide the exact XML code yet. I will find 2 instances of working and non-working strings and post them in a bit.

Do you know what are the possible causes for such an error to occur? What types of errors normally create an invalid character data exception? Any extra white-space in tags is ignored, correct?

Thanks

character data". What does this mean? When does thie error occur?

Interestingly, there is no such error. Closest one is

"Character data expected"

Is that what are you getting? Possible cause could be the empty text (IMHO)...
