- fixed problems with popup/pulldown menus on Gentoo/kde linux
- + GridCtrl can paste excel clipboard
- fixed SplitterFrame MinSize / SizeMin issues
- fixed splitter "black window" problem
- + XmlIO::Attr(..) to support default values
- fixed MenuItem Chameleon bug
- * TCore, TCtrlLib, TDraw was removed
- + plugins/dbf
- fixed most rc3 problems

Mirek

In the picture below there is no central panel with all the icons listed. I see just the first. If I press CTRL+T I see the text code of all them

I have reinstalled it again but the problem (if it is a problem) remains.

Luigi

Thank you for early bug detection.

The problem was SplitterFrame improvement:

<http://www.ultimatepp.org/forum/index.php?t=msg&th=2126&start=0&>

It should be fixed now; expect rc5 soon.

Mirek

P.S.: This release is really cursed...

Yep I agree.. but I do not think it is OsX directly, but rather that it picks the wrong font if you have ja_JP.UTF-8 set, even for the C locale text.

But if nobody else is bothered by it, let it be.

I pulled a bonehead yesterday when I wrote the upp-portage ebuild for rc4 and just removed the old rc3 before testing rc4... DOH.

Here is a patch for the top Makefile and some questions for the uppsrc/ide/Makefile.

*) is there a reason why pkg-config was not used in the uppsrc/ide/Makefile instead of hardcoding?

Top level Makefile:

- *) move all: before theide: -- if no arguments are given to make, it will run the first one which is assumed to be all.
- *) added - infront of install so that it will deal appropriately with files that already exist, etc.
- *) added trailing / to all install (cp -r *) lines. I do not know where the bug is, but it will sometimes install the files in a directory one above the destination.
- *) remove clean from all -- because the "make all" and "make install" are seperate.
- *) added mkdir -p before copying Common and other files. "cp -r Common /usr/share/upp" will not copy the Common diretory into /usr/share/upp but it's contents.
- *) current Makefiles break gentoo's multithreaded make. I'll have to investigate this one.
- *) change \$(DESTDIR)/usr/... to \$(DESTDIR)/... -- if the DESTDIR is set to usr, then everything is installed into /usr/usr.

Destdir should be set to something reasonable like /usr, /opt, etc.

I'm currently rebuilding upp (hopefully for the last time), but the folling patches should be helpful. I'll post the new upp-portage as soon as I know that it builds properly and pasts the QA tests.

The patch file should be attached.

The problem was SplitterFrame improvement:

<http://www.ultimatepp.org/forum/index.php?t=msg&th=2126& amp; amp; amp;start=0&>

Please check with open console window under Linux.
With the space limited vertically that way, the icon list didn't cope in rc3 already, like down arrow missing. And the list was hard to navigate somehow. Maybe simply close the console window automatically when switching to icon designer - and layout designer too.

Good Morning,
ebojd wrote on Mon, 02 April 2007 15:02: I pulled a bonehead yesterday when I wrote the
upp-portage ebuild for rc4 and just removed the old rc3 before testing rc4... DOH.

Here is a patch for the top Makefile and some questions for the uppsrc/ide/Makefile.

*) is there a reason why pkg-config was not used in the uppsrc/ide/Makefile instead of
hardcoding?

the uppsrc/ide/Makefile is a slightly changed Makefile which was generated by theide and theide
hardcodes it.

ebojd wrote on Mon, 02 April 2007 15:02
Top level Makefile:

*) move all: before theide: -- if no arguments are given to make,
it will run the first one which is assumed to be all.

yes, sounds good.

ebojd wrote on Mon, 02 April 2007 15:02

*) added -i in front of install so that it will deal appropriately
with files that already exist, etc.

what did you do? don't see the change in the patch either.

ebojd wrote on Mon, 02 April 2007 15:02

*) added trailing / to all install (cp -r *) lines. I do
not know where the bug is, but it will sometimes install
the files in a directory one above the destination.

yes, thought they have been there as you see the install lines.

ebojd wrote on Mon, 02 April 2007 15:02

*) remove clean from all -- because the "make all" and "make
install" are separate.

ok

ebojd wrote on Mon, 02 April 2007 15:02

*) added mkdir -p before copying Common and other files.
"cp -r Common /usr/share/upp" will not copy the Common
directory into /usr/share/upp but its contents.

yes sure makes sense

ebojd wrote on Mon, 02 April 2007 15:02

*) current Makefiles break gentoo's multithreaded make. I'll have to investigate this one.

please do so, i would like the makefile to run on as many systems as possible

ebojd wrote on Mon, 02 April 2007 15:02

*) change `$(DESTDIR)/usr/...` to `$(DESTDIR)/...` -- if the `DESTDIR` is set to `usr`, then everything is installed into `/usr/usr`.
Destdir should be set to something reasonable like `/usr`, `/opt`, etc.

I am sorry, but that is impossible for me - the package builder asks for a `$DESTDIR` to create a temporary folder where the root directory is simulated to create the package.

Any Idea how to get around this are welcome!

ebojd wrote on Mon, 02 April 2007 15:02

fallingdutch wrote on Tue, 03 April 2007 00:41

ebojd wrote on Mon, 02 April 2007 15:02

*) added - in front of install so that it will deal appropriately with files that already exist, etc.

what did you do? don't see the change in the patch either.

The comment should have read "added a '-' in front of install and cp...". Adding a '-' in front of a makefile directive instructs make to continue processing even if an error occurs. That way I can work on as many bugs as possible at one compile. This should likely be removed from the final version. We might want to discuss that though.

fallingdutch wrote on Tue, 03 April 2007 00:41

ebojd wrote on Mon, 02 April 2007 15:02

*) added trailing / to all install (cp -r *) lines. I do not know where the bug is, but it will sometimes install the files in a directory one above the destination.

yes, thought they have been there as you see the install lines.

Sorry, my bad. This was a misattempt to fix the copy problem mentioned below (that was eventually solved by first creating the directory with "mkdir -p". It should be removed.

fallingdutch wrote on Tue, 03 April 2007 00:41

ebojd wrote on Mon, 02 April 2007 15:02

*) current Makefiles break gentoo's multithreaded make. I'll have to investigate this one.

please do so, i would like the makefile to run on as many systems as possible

This one is subtle... Basically, make can run in multi threaded mode. Gentoo portage by default sets the number of processes (or jobs) to be the number of processors in the system +1. It appears that how make does this is for each given target run all dependencies simultaneously. So, when we get to ide/Makefile's lines:

all: install \$(OutFile)

install:

```
-mkdir -p $(OutDir)
-mkdir -p $(OutDir_ide)
...
```

```
$(OutFile): \
$(OutDir_ide)SelectPkg.o \
$(OutDir_ide)UppWspc.o \
...
```

make will start the compilation of \$(OutDir_ide)SelectPkg.o simultaneously with making the \$(OutDir_ide), etc., directories. So the problem is basically a race condition.

It is going to take me a little time to figure out how to patch this in a sane manner. My first attempts will be to play with the ordering of the dependencies...

I would also like to rename the install directive to pre-build or something more intuitive because this one is not **really** installing anything, but preparing the system to build.

something along the lines of:

```
all: prebuild
    $(MAKE) $(OutFile)
```

```
prebuild:
-mkdir -p $(OutDir)
-mkdir -p $(OutDir_ide)
...
```

```
$(OutFile): \
$(OutDir_ide)SelectPkg.o \
$(OutDir_ide)UppWspc.o \
...
```

There is probably a better way to fix the dependencies, but it is alluding in this red hot moment.

fallingdutch wrote on Tue, 03 April 2007 00:41

ebojd wrote on Mon, 02 April 2007 15:02

*) change \$(DESTDIR)/usr/... to \$(DESTDIR)/... -- if the DESTDIR is set to usr, then everything is installed into /usr/usr. Destdir should be set to something reasonable like /usr, /opt, etc.

I am sorry, but that is impossible for me - the package builder asks for a \$DESTDIR to create a temporary folder where the root directory is simulated to create the package.
Any Idea how to get around this are welcome!

The easy way, and possibly not the best, is to add /usr to \$DESTDIR and remove it from the hardcoded path. I will take a look at the relevant Makefile documentation and see how the Makefile builder can be modified to produce more standard Makefiles <see <http://www.gnu.org/software/make/manual/make.html> for ideas>

fallingdutch wrote on Tue, 03 April 2007 00:41

ebojd wrote on Mon, 02 April 2007 15:02

Posted by [fallingdutch](#) on Wed, 04 Apr 2007 07:20:41 GMT
[View Forum Message](#) <> [Reply to Message](#)

sorry for the late reply.

I have been wondering why my build did not work an the problem is the patch to the Makefile moving all in front of theide, because my automagic package-build environment (downloading a complete "virgin" system, adding the packages listed in the control file and trying to build it) needs a build of the binary then changes to root and runs a "make install" like it should be -IMHO-. but

when running a make now i have insufficient rights to create the dirs etc.

So you will need a "make && make install", hope that won't be to hard for you, Ebo

Bas

Posted by [ebojd](#) on Wed, 04 Apr 2007 17:21:59 GMT
[View Forum Message](#) <> [Reply to Message](#)

Hi Bas,

Separate make & make install is exactly how I run things anyway, so that is no problem.

Some thoughts on updates to the Makefile (and I'll do my best to help with this one if appropriate)...

One of the things that was customary in the *nix world, at least in the past, was to separate the build and the formal install process so that any user can build and test the system without root or administration privileges. That way you would build as a regular user, then su over to root to install any files into the base system. One of the nice advantages of setting DESTDIR without the /usr/ is that as a regular use I can do the install into my home directory by setting DESTDIR=/home/me. Likewise a sysadmin could choose nonstandard install locations (like /usr/local/ or /opt/upp). One of the things I forgot to add was the add a decent default to DESTDIR:

```
ifndef DESTDIR
    DESTDIR=/usr
endif
```

```
all: theide
```

```
theide:
$(MAKE) -f uppsrc/ide/Makefile
```

last, if install is called directly it should depend on theide:

```
install: theide
```

The rest is mainly just a case of defining terms and what things mean.

uppsrc/ide/Makefile's install directive is actually not dealing with installation, but is a prebuild step to set up the expected directory structure for the build. This should probably be remanmed.

There is still the issue of make being called with -j2 or more. I will have to play with this some more.

I need to get back to work but I'll spend some time on this tonight if I do not find myself back in bed with the flu or whatever it is that is kicking my kiester...
