I think there is a bug in ConvertString implementation. There should be GetLength() <= maxlen instead of < maxlen.

```
Value ConvertString::Scan(const Value& text) const {
    if(IsError(text)) return text;
    if(IsNull(text)) return notnull ? NotNullError() : Value(text);
    if(text.GetType() == STRING_V && String(text).GetLength() <= maxlen ||
        text.GetType() == WSTRING_V && WString(text).GetLength() <= maxlen) return text;
    return ErrorValue(UPP::Format(t_("Please enter no more than %d characters."), maxlen));
}
```
