[View Forum Message](#) <> [Reply to Message](#)

Hello!

I have discovered Ultimate++ some weeks ago. And I LOVE IT!!!

As an exercise to get used to Ultimate++ I made a small patch which adds the functionality to:

Highlight all errors in the editor(s) after an "compile", "build" and "rebuild".

After applying the patch, compiling and running TheIDE:

=> Open The Menu: Settings->Environment

=> Go to the tab: Editor

=> Check if "Highlight Errors" is enabled

=> Go to the tab: "Syntax highlighting"

=> Give the entry "Compile Error" your preferred color (Unfortunately i have not found the place in the source where the default colors are defined, ... and the default color is now "transparent")

=> Open a source file

=> Create an error (type some random stuff)

=> Compile or Build the project

=> See the result

I don't know if there exists interest in further development of the feature and I also don't know if my code matches the expected quality. Especially because I'm just starting with Ultimate++

My next step would be to add a "background compile".

What I mean is: If you are editing a file and make a break for 3 seconds. I would start an compile

=> all errors gets highlighted.

=> A background syntax check. Of course it can be enabled/disabled via the settings.

- Ralf

That's great! Mirek, I can check and apply this patch if you don't mind.

Yesterday I also extended highlighting capabilities. I added highlighting of text in UPPER, sql functions, sql boolean expressions and ultimate macros. So now expressions like SQL * Select(NAME, AGE).From(PEOPLE).Where(ID=1) looks much better IMO.

Quote:

(Unfortunately i have not found the place in the source where the default colors are defined, ... and the default color is now "transparent")

I'm searching this one too...

Well, I'm not so satisfied anymore. Have to learn a little bit more about the structure of TheIDE...

I will give it a second try. This time I will use EditBar.cpp (where the breakpoints are located) and mark the background in red instead of highlighting the whole line.

This will probably solve the problem in the current solution: If you insert a line the highlighted error line does not move down...

=> Errors should more behave like breakpoints.

I'm not satisfied with other parts to:

- * Warnings get highlighted, too (not nice, at least it should be in a different color)

...

So, better forget this path...

Ok, I'll wait for better solution. Not highlighting the whole line as well as different colors for errors and warnings is a good idea. Keep working

unodgs wrote on Wed, 16 May 2007 11:15Ok, I'll wait for better solution. Not highlighting the whole line as well as different colors for errors and warnings is a good idea. Keep working

Oops, this took longer than I expected.

Here comes the second try:

Errors and Warnings are now marked with different colors (red / yellow) in the small column where the breakpoint icon is placed.

Build and Rebuild automatically clears all existing error markers in all files

Compile File automatically clears all existing error markers in the current file.

Editing a line with an error marker will remove the error marker.

Error markers are moving with newly inserted lines like breakpoints.

In addition to the error/warning marking feature above:

I mark all lines edited since the last start of TheIDE in blue. I really love this feature and I'm very used to it from Source Insight. Very useful to find the places you have edited.

Makes use of existing data structures (breakpoints).

Hope you like it too!

This patch is great! I'm only wonder if that blue markers should not be cleared after save. Or better after some keys combination pressing. But what I think would be really superb is that after each save the old blue marker become lighter and the new change gets initial blue color. What do you think?

Anyway I have added this patch. Let people try it and make suggestion.

BTW: I'm in process of reimplementing quicktabs. Expect something really great (at least I think so)

Nice to hear you like it.

I like your suggestion to dim out the edited marker. Sounds not to complicated to implement. But I would prefer to have them allways slightly visible. At least not to remove them after save... But if necessary I could add a hot key and/or toolbar icon.

What I'm still missing are tooltips. I would be great to have a tooltip fo each line with an

error/warning with the error message.

If you like the idea I can try it.

This would be a good starting point for more tooltips in the editor like for a variable the type. Or in the debugger the current value of a variable.

I'm interested in you quicktabs! This was another point which I consider improveable beside some other small things.

Well, and what I really would like to have are some basic refactoring functions like renaming a class, function, etc.

But I guess I have to collect some more experion points with Ultimate++ before thinking about implementing it, but on the other hand the internal parser and the functionality from assist seems to be allready enough to try to implement it.

So, after the new version becomes available in subversion I will continue with edit/error markers for a short time.

But I guess I have to collect some more experion points with Ultimate++ before thinking about implementing it, but on the other hand the internal parser and the functionality from assist seems to be allready enough to try to implement it.

That would be fantastic!

I thought also about functions like add class (from user templates) to the project, add dialog to the project (this should add dialog.h dialog.cpp and dialog.lay files) etc.

If Mirek would implement block operations and improve c++ parser theide would be the best in the market

The aging of the edit marker works, now. Plus some small bugfix, some files were marked edited, even if there was no edit.

unodgs wrote on Wed, 16 May 2007 23:17

Quote:

I was starting to add the other stuff, but then I got unsure.

Is one hot key to clear all edit markers in all files enough, or do you think it is necessary to have another hot key to clear only the markers in the current file?

Do you think we should have a toolbar icon for it?

In the settings:

Is it enough to have the option to disable the edit markers. Or do you think the marking of the errors and warnings should also be configureable?

I'm asking because I think: The edit markers are not such an important thing to polute the toolbar and settings with it...

But thats just my personal opinion.

So I would suggest:

One hot key to clear all markers in all files. No toolbar icon.

One option in the settings to disable the edit /errors / warning markers together.

But I'm open for other opinions!

Quote:The aging of the edit marker works, now. Plus some small bugfix, some files were marked edited, even if there was no edit

I also noticed a bug when one undo changes. Markers should be cleared then.

Quote:So I would suggest:

One hot key to clear all markers in all files. No toolbar icon.

One option in the settings to disable the edit /errors / warning markers together.

I agree + hotkey to clear markers in one file.

I also noticed a bug when one undo changes. Markers should be cleared then.

I absolutely agree thats not nice. Unfortunately this is probably not easy to fix.

This would require a deeper change to the internal structures.

But there might exist a simpler solution:

If I would store the original line for each edit marker I could change the edit markers to "changed lines markers".

Which means if you change a line and later change it back to the original line, even by typing -> the marker would disappear completely.

May be thats even better than an edit marker?

[View Forum Message](#) <> [Reply to Message](#)

I just installed the latest Upp-mingw-dev-whatever package from SourceForge and the default highlight colour for Upp macros is set to white.

Being completely unaware of the highlighting changes this resulted in great confusion

I think this should probably be fixed.

Subject: Re: Patch: Highlight Errors

[View Forum Message](#) <> [Reply to Message](#)

Here is the new patch for the edit markers.

- * bugfix: Some files were marked edited, even if there was no edit
- * bugfix: If editor window is split: In Editor2 all lines were marked as edited
- * Edit marks slowly blend out with each edit (I preferred this over aging them with each save)
- * Edit / Error / Warning markers can now switched of in Settings-Editor
- * Hot Keys and entry in Edit-Menu: I added a third option: Remove Markers for selection. Menu entries will disappear if Markers are turned of via Settings. I didn't know how to add a hot key without generating a menu entry... But may be its good to have it in the menu, anyway.

Undo bug is still not fixed...

I will try to change the "edit markers" to "change markers".

I think I have found a way to track the changes and mark all changed /new / deleted lines with it's own color without wasting much memory and cpu-cycles. This would solve the undo problem, too. In addition there would be the possibility to select some changed lines and revert to the original lines with a hot key. Similar to an undo for selected lines. The revert to original lines operation would be stored in the general undo history. So you can still do a complete undo of the file, even if you have performed a revert operation for some lines.

Thanks!

Here comes the update (patch is based on revision 58).

I gave up on tracing the changes instead of the edits...

Instead the following changes:

- * UNDO removes the edit markers, now! Was a lot of work!
- * Removed "Remove change markers from Selection" in menu and hot keys, because I considered it not very useful.
- * Find in Files marks the line where the search term occurs in green.

- Ralf

unodgs wrote on Wed, 23 May 2007 08:29UVS != SVN Uvs is our internal versioning system.
Search this forum to find out how to use it.
Ahh, I see there seems to be another repository!

Well, what I have found so far is not much.
I could not find a pointer where to get uvs (uvs2.exe?) and even if I would find it... I could not find a hint to the location fo the ftp server holding the repository.
Looks a little bit like secret black voodoo magic

unodgs wrote on Wed, 23 May 2007 08:29PS: What about find in files? Does it work for you?

Yes seems to work, here. Just checked it again.
May be there was a problem with the upload on the server.
I uploaded the patch. Later - while doing some programming - found some bugs I have missed.
Edited the message. Removed the patch and uploaded a new one with the same name in one step.

Anyway, I have started with these markers and luckily you applied the patches to ultimate++.
Because I would like to have a working "bug free" version I will try to check and fix it as soon as I can.
So, if I do not find out more about uvs I will wait until subversion is updated check the current state of the markers and supply a new patch as fast as I can, before uvs is out of sync with svn.

Ok here comes the patch.

There was probably a merge error.

I fixed another bug: With new files no markers appeared until switching to another tab.

While doing the merge I recognized the space between if / for and (were removed. if () -> if()...
I will try to adapt to the upp-style. But old habbits are hard to fight

BTW: The new Tabs are nice!!!

Middle Click does not remove the tab, yet. But I guess you already now, this.

I feel the same about opening curly bracket in line with code...

(that reminds me I must reformat quicktabs code..)

Quote:Middle Click does not remove the tab, yet. But I guess you already now, this.

I was trying to implement that at least on win32 platform - without success (yet). The problem is Upp does not provide a common way to handle middle click. In win32 it maps middle click to left click.

[View Forum Message](#) <> [Reply to Message](#)

Quote:The problem is Upp does not provide a common way to handle middle click. In win32 it maps middle click to left click.

Can't you just override MouseEvent?

```
virtual Image MouseEvent(int event, Point p, int zdelta, dword keyflags)
{
    if (keyflags & K_MOUSEMIDDLE) {
        switch (event) {
```

```
case LEFTDOWN:
    MiddleDown(p, keyflags);
    break;
case LEFTDOUBLE:
    MiddleDouble(p, keyflags);
    break;
//..Etc.
default:
    return Ctrl::MouseEvent(event, p, zdelta, keyflags);
}
}
else
    return Ctrl::MouseEvent(event, p, zdelta, keyflags);
return Image::Arrow();
};
```

It definitely works on Win32, but looking at the mouse event code I can't see any reason why it wouldn't also work on X11. You could also do the keyflags check in LeftDown for the same effect.

Presumably there was a good reason for not having specific handling functions for middle clicks in Upp, but I don't know what it was.

New (daily) Markers patch...

Changes:

* Bugfix: Compile Errors on MINGW

- * Bugfix: Sometimes (after Build) some markers disappeared
- * Bugfix: Lines containing errors sometimes marked in green instead of red
- * Bugfix: Blend-color (age of marker) sometimes was wrong
- * New Color for the marker: yellow-green
- * Cleanups

- Ralf

unodgs wrote on Thu, 24 May 2007 22:45: Is this all included in MarkErrorsAndEdits_4.patch (which is now merged)?

No. I uploaded a new patch, but as usual found some more errors -> and deleted it from the message board.

Sorry!!

Just prepare the next version if you want, even without the new patch. I will do more testing this time and upload a new patch if I consider it, ready. If in the meanwhile svn is updated, that's no problem. I will do the merge here and supply a patch on the latest svn.

Sorry, again for so much trouble about such a small thing...

Presumably there was a good reason for not having specific handling functions for middle clicks in Upp, but I don't know what it was.

Based on the false idea that narrow interface is better (and middle clicks are not much often used anyway).

Maybe this is the time to add it. The only question is backward compatibility, however, deleting K_MIDDLEMOUSE would solve the problem (That small pack of apps that require it would not compile.... -> easy to fix).
