I have checked current version and found some strange things. In PostgreSQLSchema.h there are some buggy lines:

```
#define SERIAL(x)           COLUMN("integer autoincrement", int64, x, 0, 0) //int is not enough,  
as it is unsigned  
#define SERIAL_ARRAY(x, items)  COLUMN_ARRAY("integer autoincrement", int64, x, 0, 0,  
items)  
#define SERIAL_(x)           COLUMN_("integer autoincrement", int64, x, 0, 0)  
#define SERIAL_ARRAY_(x, items) COLUMN_ARRAY_("integer autoincrement", int64, x, 0, 0,  
items)  
  
#define BIGSERIAL(x)          COLUMN("integer autoincrement", int64, x, 0, 0)  
#define BIGSERIAL_ARRAY(x, items) COLUMN_ARRAY("integer autoincrement", int64, x, 0, 0,  
items)  
#define BIGSERIAL_(x)          COLUMN_("integer autoincrement", int64, x, 0, 0)  
#define BIGSERIAL_ARRAY_(x, items) COLUMN_ARRAY_("integer autoincrement", int64, x, 0, 0,  
0, items)
```

The above lines would be useful in SQLite (I wanted to propose it), but not in PG. The correct lines would be:

```
#define SERIAL(x)           COLUMN("serial", int64, x, 0, 0) //int is not enough, as it is unsigned  
#define SERIAL_ARRAY(x, items)  COLUMN_ARRAY("serial", int64, x, 0, 0, items)  
#define SERIAL_(x)           COLUMN_("serial", int64, x, 0, 0)  
#define SERIAL_ARRAY_(x, items) COLUMN_ARRAY_("serial", int64, x, 0, 0, items)  
  
#define BIGSERIAL(x)          COLUMN("bigserial", int64, x, 0, 0)  
#define BIGSERIAL_ARRAY(x, items) COLUMN_ARRAY("bigserial", int64, x, 0, 0, items)  
#define BIGSERIAL_(x)          COLUMN_("bigserial", int64, x, 0, 0)  
#define BIGSERIAL_ARRAY_(x, items) COLUMN_ARRAY_("bigserial", int64, x, 0, 0, items)
```

I would propose some other lines to SQLite for compatibility with PostgreSQL:

```
#define CLOB(x)               COLUMN("text", String, x, 0, 0)  
#define CLOB_(x)              COLUMN_("text", String, x, 0, 0)
```

BTW in my dev environment, I use SERIAL differently, because I wanted a common .sch file for my SQLite and PostgreSQL databases with the same behaviour.

So I use these lines for SQLite:

```
#define SERIAL(x)           COLUMN("integer primary key autoincrement", int64, x, 0, 0) //int is
```

not enough, as it is unsigned

```
#define SERIAL_ARRAY(x, items)    COLUMN_ARRAY("integer primary key autoincrement",
int64, x, 0, 0, items)
#define SERIAL_(x)                COLUMN_("integer primary key autoincrement", int64, x, 0, 0)
#define SERIAL_ARRAY_(x, items)   COLUMN_ARRAY_("integer primary key autoincrement",
int64, x, 0, 0, items)

#define BIGSERIAL(x)             COLUMN("integer primary key autoincrement", int64, x, 0, 0)
#define BIGSERIAL_ARRAY(x, items) COLUMN_ARRAY("integer primary key autoincrement",
int64, x, 0, 0, items)
#define BIGSERIAL_(x)            COLUMN_("integer primary key autoincrement", int64, x, 0, 0)
#define BIGSERIAL_ARRAY_(x, items) COLUMN_ARRAY_("integer primary key autoincrement",
int64, x, 0, 0, items)
```

and these lines for PostgreSQL:

```
#define SERIAL(x)                 COLUMN("serial primary key", int64, x, 0, 0) //int is not enough, as it
is unsigned
#define SERIAL_ARRAY(x, items)   COLUMN_ARRAY("serial primary key", int64, x, 0, 0, items)
#define SERIAL_(x)                COLUMN_("serial primary key", int64, x, 0, 0)
#define SERIAL_ARRAY_(x, items)  COLUMN_ARRAY_("serial primary key", int64, x, 0, 0,
items)

#define BIGSERIAL(x)              COLUMN("bigserial primary key", int64, x, 0, 0)
#define BIGSERIAL_ARRAY(x, items) COLUMN_ARRAY("bigserial primary key", int64, x, 0, 0,
items)
#define BIGSERIAL_(x)             COLUMN_("bigserial primary key", int64, x, 0, 0)
#define BIGSERIAL_ARRAY_(x, items) COLUMN_ARRAY_("bigserial primary key", int64, x, 0, 0,
items)
```

So SERIAL in my terminology means a field type as it is incrementing automatically, serves as a primary key, and records can never have the same (old) id after deleting rows.

At the moment I am not using either...

Can anybody comment about this? Which patches should we apply?

What is the problem with explicitly defining column as PRIMARY\_KEY?

SERIAL (ID) PRIMARY\_KEY

I think primary\_key attribute should be removed from sqlite schema to preserve consistency instead of adding it to postgresql.

Besides PostgreSQL documentation says:

Note: Prior to PostgreSQL 7.3, serial implied UNIQUE. This is no longer automatic. If you wish a serial column to be in a unique constraint or a primary key, it must now be specified, same as with any other data type.

The problem is, that I need the same .sch file for PostgreSQL and SQLite. But "ID\_FIELD integer autoincrement primary key" is not allowed in SQLite. The correct column definition is "ID\_FIELD integer primary key autoincrement".

In any case, trying SQL\_Postgresql, SERIAL was the first thing I had to fix...

What was the problem? (Currently I'm unable to connect to the UVS server.)

Well, this was the first time I tried postgresql... With the current version, postgresql reported error on executing the schema - the exact one described in this thread. So I have changed SERIAL

definitions as suggested here and everything is OK now...
