Hello,

I searched the forum for this build error but i could not find it.

If i create a new package (linux) with template "CtrlLib application with main window" the generated code is missing the line "using namespace Upp;"

This is generated and will not compile:

```
#ifndef _test_test_h
#define _test_test_h

#include <CtrlLib/CtrlLib.h>

#define LAYOUTFILE <test/test.lay>
#include <CtrlCore/lay.h>

class test : public TopWindow {
public:
 typedef test CLASSNAME;
 test();
};

#endif
```

This will compile:

```
#ifndef _test_test_h
#define _test_test_h

#include <CtrlLib/CtrlLib.h>

#define LAYOUTFILE <test/test.lay>
#include <CtrlCore/lay.h>

using namespace Upp;

class test : public TopWindow {
public:
 typedef test CLASSNAME;
 test();
};

#endif
```

I am using version 2007.1

I checked on windows, the line "using namespace Upp;" is added.
It will build on windows without modification.

I think it is linux related, you must add the line "using namespace Upp;" to build it.

Greetings,
Gertwin
