I have just been lucky enough to get two dell wide flat panels. I have the primary one as normal and the secondary one rotated 90 degrees so the long side is vertical. As you can imagine I was very excited to try out coding under UPP with my new setup but the IDE refuses to go longer vertically than the vertical extent of my primary monitor.

Would love a fix but realise this can't possibly qualify as a priority

Nick

I don't use the rotated setup, but thelde keeps starting on primary monitor no matter on which one I do close it.

(windows XP)

Other win applications do remember the screen where they have been closed.

Other thing.. when I run thelde, it opens with package selector ... move the package selector window to secondary screen ... select package .. thelde opens again on primary screen.

Not very user friendly, but not important at all, I got used already to have thelde on primary screen and run other apps on secondary.

Yeah I don't mind opening it up (although my little fingers do get tired ) this is more an issue of getting it to open to the full extents of the second monitor.

Update: In fact neither the IDE nor the help window can be dragged to have a vertical extent larger than that of the primary monitor - would be nice to have those long lists of functions open on my 1680 pixels long (x1050wide) screen
